

QA Test Case Report for Safora Website

Testing Method: Exploratory Manual Testing

Application: Safora Website

Document Type: Test Execution Report

Prepared By: Ayesha Jayasinghe

Date: 19/05/2026

1. Overview

This document contains exploratory manual test cases created for the Safora website. The Safora website was tested to verify the functionality and usability of key user facing features. The focus was on ensuring smooth user interaction, proper validations, and correct system responses.

The following areas were mainly covered:

- **Contact Us Form:** Tested form submission, input validations, and system response for both valid and invalid data.
- **Book a Demo:** Verified form flow, field validations, and successful submission behavior.
- **Navigation Flow:** Checked all menu links and page transitions for proper redirection.
- **Language Toggle:** Ensured language switching works correctly without UI or content issues.

2. Testing Objectives

- To evaluate the usability of the Safora website
- To validate key user journeys such as navigation and contact form submission
- To identify UI/UX issues and functional defects
- To verify input validations and error handling
- To assess mobile responsiveness and form behavior

3. Test Approach

Exploratory testing was performed using the following approach:

- Navigated through the website as a real user
- Identified key user flows (Home → Contact Form → Submission)
- Entered valid and invalid data into input fields
- Observed system responses and validation messages
- Tested boundary conditions (empty fields, invalid formats, long inputs)
- Checked UI behavior across different screen conditions (basic mobile view simulation)

4. Scope of Testing

Included:

- Home page navigation
- Contact Us page functionality
- Contact form validation
- Form submission behavior
- Input field validations
- reCAPTCHA behavior
- Basic UI responsiveness
- Language and navigation flow (if applicable)

Not Included:

- Backend/API testing
- Performance/load testing
- Security penetration testing
- Database validation

5. Test Scenarios Overview

- Verify Contact Us form with valid inputs
- Verify mandatory field validations in Contact Us form
- Verify invalid email format validation
- Verify phone number field validation
- Verify message field validation
- Verify form submission without CAPTCHA
- Verify successful Contact Us form submission
- Verify working status of 'Book a Demo' Button
- Verify website navigation flow through menu options
- Verify page redirections and link functionality
- Verify language toggle functionality
- Verify UI behavior after language switching
- Verify responsiveness and usability in different screen sizes

6. Test Execution Details

Drive Link for the Test Cases:

7. Test Execution Summery

Metric	Value
Total Test Cases	23
Passed Test Cases	19
Failed Test Cases	04
Overall Status	Partially Passed

8. Observations & Findings

- Contact form accepts valid inputs and allows submission successfully
- Email field does not strictly accept invalid formats (validation observed but may vary)
- Name field accepts special characters and long inputs without strict restriction
- Phone field allows excessive digit input (no clear validation limit observed)
- Message field has a minimum character requirement (~10 characters)
- reCAPTCHA is present and sometimes requires manual interaction
- Success popup appears after valid submission
- UI is generally clean, but validation feedback could be improved

9. Identified Risks

- Weak input validation on key fields (name, phone)
- Lack of strict enforcement for data format rules
- Potential for incorrect or malformed data submission
- reCAPTCHA dependency may impact on automation testing reliability

10. Recommendations

Observation	Recommendation
Name field accepts special characters and numeric values	Restrict Name field to alphabetic characters, spaces, hyphens, and apostrophes only
Name field accepts more than 256 characters without restriction	Add maximum character length validation for the Name field
Phone Number field allows excessive digit input	Implement phone number length validation
reCAPTCHA dependency may impact automation testing reliability	Use test environment bypass or disable CAPTCHA in QA/staging environments

11. Conclusion

The Safora website was tested across key functional areas including Contact Us, Book a Demo, Navigation Flow, and Language Toggle. Overall, the main functionalities are working as expected with proper navigation and user interaction flow.

Form validations and system responses are generally consistent, and users are able to interact with the website without major functional issues. Minor improvements may be required in input validation handling and UI consistency across different scenarios.

The website provides a stable user experience for end users, and the tested modules are suitable for basic production use with standard usability performance.
